

ABSTRACT OF THE DISCLOSURE

An illusion toy has a housing in which a blade is rotated in one direction too rapidly to be seen through 270 degrees between rest positions on respective opposite sides of an article receiving through hole, providing the illusion that the blade has rotated in an opposite direction across the through hole, through the article. An actuating lever for a blade rotating overcenter mechanism has a loop aligned with the through hole so that a trigger end of the lever can be visibly moved between opposite sides of the through hole in the same direction as the apparent movement of the blade. A hollow housing handle forms a candy dispensing store and connects to a delivery chute extending across the housing obscuring a radially outer portion of the blade path providing an impression that rotation of the blade in the one direction is blocked by candy.
